Sequence 6, Application US/09938719
Patent No. US20020106742A1
GENERAL INFORMATION:
APPLICANT: SAMSON, MICHEL
PARMENTIER, MARC
VASSART, GILBERT
LIBERT
LIBERT FREDBERICK
TITLE OF INVENTION: ACTIVE AND INACTIVE CC-CHEMOKINES RECEPTOR
NUMBER OF SEQUENCES: 17
CORRESSEE: AND NUCLEIC ACID MOLECULES ENCODING SAID RECEPTOR
NUMBER OF SEQUENCES: 17
CORPUSESSEE: KNOBBO, Martens, Olson & Bear
STREET: 620 Newport Center Drive 16th Floor
CITY: Newport Beach
STATE: CA
COUNTRY: U.S.A.
COUNTRY: U.S.A.
COUNTRY: U.S.A.
COUNTRY: U.S.A.
COUNTIER READABLE FORM:
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PATENTION: CURRENT NEW APPLICATION NUMBER: US/09/938,719
FILING DATE: 27-ULY-2000
ATTONELLING DATE: 27-ULY-2000
ATTONELLING DATE: 27-ULY-2000
ATTONELLING DATE: 27-ULY-2000
ATTONELLING DATE: 127-ULY-2000
ATTONELLING DATE: 127-ULY-2000
ATTONELLING DATE: 100-16
SEQUENCE CHARACTERISTICS:
LENGTH: 215 sanino acids
TYPE: ammino acids
TYPE: ammino acids
TYPE: mino acids
TYPE: mino acids
TYPE: mino acids
TYPE: mino acids
TYPE: protein
SEQUENCE DESCRIPTION: SEQ ID NO: 6:
```

Sequence 1, Application US/09796202

Patent No. US20020068813A1

GENERAL INFORMATION:
APPLICANT: Dragic, Tatjana
APPLICANT: Olson, William
TITLE OF INVENTION: SULFATED CCR5 PEPTIDES FOR HIV-1 INFECTION
FILE REFERENCE: 2048/61010/JPW/SHS
CURRENT APPLICATION NUMBER: US/09/796,202
CURRENT FILING DATE: 2001-02-28
NUMBER OF SEQ ID NOS: 17
SOSTWARE: Patentin version 3.0
SEQ ID NO 1
LENCTH: 352
TYPE: PRT

domains 5-7. CCRS serves as a co-receptor for infection by macrophage-tropic (M-tropic) strains of HIV-1. Individuals concerning the CCRS-delta32 mutation are resistant to HIV-1. CCRS-delta32 mutation are susceptible. The CCRS-delta32 mutation are resistant of variant CCRS-delta32 mutation who, if infected, may be used to identify CCRS-delta32 mutation who, if infected, may exhibit slower progression to CC diagnostic methods for detecting the presence of such variants. A CC expressing the CCRS-delta32 mutation has provided for inhibiting HIV-1 infection of a cell expressing the CCRS-delta32 mutation has involves introducing a nucleic CC number of functional CCRS-molecules present on the cell surface.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PR XX PA XX PA XX PA XX PA XX XX PA XX XX DR

      human immunodeficiency virus; type 1; type 2; HIV-1; HIV-2; dlagnosis; treatment; prevention; inflammatory disease; rheumatoid arthritis; glomerulonephritis; asthma; idiopathic pulmonary fibrosis; psoriasis; viral infections.
                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is an inactive human CC (Cys-Cys) chemoking receptor 5 (CCR5), which is not a receptor of human immunodeficiency virus type 1 or type 2 (HIV-1 or HIV-2). CCR5 or its cDNA can used to diagnose, treat and/or prevent inflammatory diseases, e.g. rheumatoid arthritis, glomerulonephritis, asthma, idiopathic pulmonary fibrosis and psoriasis, viral infections, especially HIV-1 or HIV-2 infection, cancer, atheroscierosis and autoimmune disorders. Subjects that express the inactive receptor have a predisposition, or resistance to HIV-1 and/or HIV-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (EUKO-) EUROSCREEN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-MA

Active CCR-5 is also a receptor of human immunodefictency virus type 1 or type 2 (HYV-1 or HIV-2). CCR5 or its CDNA can used to diagnose, treat and/or prevent inflammatory diseases, e.g. rheumatoid arthitis, glomerulonephritis, asthma, idiopathic pulmonary fibrosis and psoriasis, viral infections, especially HIV-1 or HIV-2 infection, cancer, atherosclerosis and autoimmune disorders.
Chemokine receptor 88C; atherosclerosis; rheumatoid arthritis; tumour; asthma; viral infection; AIDS; inflammation; autoimmune disease; therapy; diagnosis; leukocyte trafficking;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Homo

                                                                                                                                                                                                                                                                                                        This invention describes a novel receptor polypeptide (I) selected from (I) a fully defined 329 amino acid sequence (II) fully disclosed in the specification; and (II) a polypeptide encoded by the cDNA contained in a CC plasmid, and fragments, analogs and derivatives of the polypeptide. The CC products of the invention have antificiammatory, immunomodulatory, CC anticoagulant, antiallergic, immunosuppressive, vulnerary, cytostatic, CC antiparasitic, antipacriatic, antirheumatic, antiarthritic and vasotropic activity and can be used for gene therapy. The G-protein chemokine CC activity and can be used for gene therapy. The G-protein chemokine CC activate or inhibit activation of (I). The products of the invention can also be used for stimulating hacmatopolesis, wound healing, coagulation, CC anglogenesis, treating solid tumours, chronic infections, leukemia, CC Tcell mediated autoimmune diseases, parasitic infections, psoriasis, and CC allergy, atherogenesis, anaphylaxis, malignancy, chronic and acute inflammation, histamine and immunoglobulin E (IGE)-mediated allergic calcions, prostaglandin-independent fever, bone marrow failure, CC silicosis, sarcoidosis, rhoumatoid arthritis, shock and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents the human CCR5 protein sequence. The invention relates to a method for determining whether an agent is capable of modulating the interaction of chemotactic chemokine receptor (CCR5) with 9p120, comprising incubating the agent with CCR5 and 9p120 and determining whether the agent modulates the interaction, where 9p120 is associated with CD4, and where the interaction is a low affinity binding. The method is used to identify an agent capable of modulating the interaction of CCR5 with 9p120. An agent identified by the method is used to prepare a pharmaceutical composition for the treatment of a disease or condition associated with CCR5 and 9p120 interaction, to treat a subject with a disease or condition associated with CCR5 and 9p120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Determining if an agent can modulate CCR5-gp120 interaction, incubating the agent with CCR5 and gp120 and determining if
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          interaction, and for preparing a pharmaceutical for treating human immunodefictency virus (HIV). It can also be treat anti-inflammatory diseases. The method is commercially useful, amenable to high throughput screening, and detects interaction of gp120 with cells expressing only
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        modulates

                                                                                                                                                                                                                                                                                                   the cell surface of transformed mammalian cell. The invention is useful for identifying drugs or antibodies that interfere with the translocation of HIV into transformed mammalian cell or for identifying a human chemokine receptor that facilitates the infection of a particular HIV strain into the transformed mammalian cell. Compounds identified can be used to treat cellular dysfunction and to prevent or combat HIV infection. The present sequence is a human chemokine receptor (CKR), CC-CKR-5 related protein. CC-CKR-5 is the principal cofactor for entry mediated by the envelope glycoproteins of primary macrophage-tropic
                                                                                                                                                                                                                                                                                                                                                                                                                                     repeat

The disease or disorder may also be an infectious disease CC (e.g. a viral infection, such as an early stage HIV infection, a CC disease (e.g. rheumatoid arthritis) or a neurodegenerative disorder. The CC disease or disorder may be associated with aberrant CCR5 expression, lack CC function. CCR5 HDGNR10 protein is used as a food additive or preservative CC function. CCR5 HDGNR10 protein and in gene therapy. CCR5 HDGNR10 DNA are useful CC protein, antibodies, agonists and antagonists are also useful in the CC disposis, treatment and prevention of cancer (breast, ovary, adrenal CC urogenital); immune disorders (Addison's disease, allergies, autoimmune CC disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis); cardiovascular disorders (myocardial ischaemias) and colitis); cardiovascular disorders (myocardial ischaemias) and colitis); cardiovascular disorders (myocardial ischaemias) and county protein. The present sequence is human CCR5 HDGNR10 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ş

The present sequence is that of human HIV-1 co-receptor CCR5.

CC Amino acids 2-18 in the N-terminal region of CCR5 comprise an HIV-1 CC gp120-binding site that determines the specificity of the CC interaction between CCR5 and HIV-1 gp120. Post-translational CC sulfation of the tyrosine residues in the CCR5 N-terminus is CC susceptibility of target cells to HIV-1 infection in vivo. The CCC susceptibility of target cells to HIV-1 infection in vivo. The CCC are based on the CCR5 N-terminal region and which are effective CC for inhibiting HIV-1 binding to CCR5. These peptides are used in CC claimed methods of inhibiting HIV infection of CD4+ cells, of C1 claimed methods of inhibiting HIV infection of CD4+ cells, of CCR5 receptor. The methods may be carried out in a subject whose CD4+ cells are infected with HIV, and of cCR5 receptor. The methods may be carried out in a subject which inhibits binding of a CCR5 ligand to a CCR5 receptor. The methods may be carried out in a subject which inhibits binding of a CCR5 ligand to a cCR5 receptor. The methods may be carried out in a subject who is not infected with HIV (prophylactic method), or in a subject who is not infected to with, but has been exposed to, HIV.

Isolated nucleic acid encoding a human G-protein chemokine receptor (CCR5) HDGNR10 polypeptide, useful for preventing or treating autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders and neurodegenerative disorders -

Example 40; Page 486-487; 495pp; English

CC protein. CCR5 HDGNRIO antibodies are useful for treating, preventing a disease or disorder associated with inflammation, CCC or ameliorating a disease or disorder associated with inflammation, CCC defective or aberrant chemotaxis of immune cells, HIV infection (such as CC aberrant T-cell antigen presenting cell interaction. The disease or CC aberrant T-cell antigen presenting cell interaction. The disease or CC as an early stage HIV infection, a cytomegalovirus infection such CC an enurodegenerative disorder. The disease (e.g. a viral infection such CC an enurodegenerative disorder. The disease or disorder may be associated CC with aberrant CCR5 expression, lack of CCR5 incation, aberrant CCR5 (with aberrant CCR5 axpression, lack of CCR5 incation, aberrant CCR5 (company) and company c The present sequence is human G-protein chemokine receptor (CCR5) HDGNR10 protein. CCR5 HDGNR10 antibodies are useful for treating, preventing

Non-endogenous constitutively activated versions of known GPCRs are used in the invention for the direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists. Such agonists are useful as therapeutic agents for diseases or disorders associated with GPCRs. The present sequence is a non-endogenous version of a known human GPCR.
                                                                                                                                                         119

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC chemokine receptor that has been designated CCR5. The sequence was deduced from an isolated cDNA clone (see AAT76920). An Ala177Leu variant (see W238340 of CCR5 was also identified. The susceptibility cof human macrophages to HIV infection depends on cell surface expression of CD4 and CCR5. CCR5 is a member of the 7-transmembrane capperfamily of G-protein coupled cell surface molecules. It plays can essential role in the membrane fusion step of infection by some CRT visolates. The establishment of stable, non-human cell lines and transgenic mammals having cells that coexpress human CD4 and CCR5 provides valuable tools for research of HIV infection. CRS provides valuable tools for research of HIV infection. CRS capable of blocking membrane fusion between HIV and target cells represent potential anti-HIV therapeutics for macrophage

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This is the amino acid sequence of wild-type human CCR5, which correceptor for infection by macrophage-tropic (M-tropic) strains of HIV-1. The invention relates to the CM-tropic) strains of HIV-1. The invention relates to the invention relates to the CM-tropic) strains of HIV-1. The invention relates to the comprising the first two transmembrane domains of wild-type CCR5, comprising the first two transmembrane domains of wild-type CCR5, comprising the first two transmembrane domains of wild-type CCR5, comprising the first two transmembrane domains of wild-type CCR5, comprising the many indicate shows a positive correlation with respice HIV-1 correlation with respication of the disease. The CM-trains, and may indicate slower progression of the disease. The converted, and the properties of the disease of the converted, may exhibit slower progression to AIDS. Probes and infected, may exhibit slower progression to AIDS. Probes and converted the presence of such variants. A method is provided for inhibiting HIV-1 infection of a cell expressing the CCR5 creek converted to the cell, thereby reducing a nucleic acid encoding a CCR5 correction.

Post-processing: Minimum Match 08

Maximum Match 100 Listing first 45 summaries

Database : prR_73:* 1: pir1:* pir2:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C;Function:
A;Description: G protein-coupled receptor for chemokines MIP-lalpha, MIP-lbeta
A;Note: probably acts to control granulocyte proliferation and differentiation
C;Superfamily: vertebrate rhodopsin
                                                                                                                                                                                                                                                                                                                                  R;Yamagami, S.; Tokuda, Y.; Ishii, K.; Tanaka, H.; Endo, N.
